**Description** This subject covers the analysis and control of dynamical behaviour of mechanical systems. It discusses the fundamental principles in controlling mechanical dynamic systems. In particular, the subject will cover contents in: multi-degree of freedom vibration analysis and modelling; open and closed loop systems; transfer function and state variable methods in mechanical system modelling; concepts of stability; design and analyse control systems using root-locus, bode diagram and state-space methods for mechanical systems.

## Learning Outcomes

On successful completion of this subject, students should be able to:

1. Analyse and develop mathematical models of multi-degree of freedom mechanical dynamical systems.
2. Analyse system response characteristics based on physical properties of the system.
3. Determine absolute and relative stability of a system using system responses to various control inputs and disturbances.
4. Analyse the effects of a controller in the system and its effects on system stability.
5. Design controllers in both frequency and time domain for linear time-invariant systems.

## Subject Content

- Multi-degree of freedom vibration analysis and modelling;
- Open and closed loop systems;
- Transfer function and state variable methods in mechanical system modelling;
